AE 04: NYC flights + data wrangling

Hannah Andronyk

```
library(tidyverse)
library(nycflights13)
```

Exercise 1

Your turn: Fill in the blanks:

The flights data frame has 336,776 rows. Each row represents a flight.

Exercise 2

Your turn: What are the names of the variables in flights.

glimpse(flights)

```
Rows: 336,776
Columns: 19
               <int> 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2~
$ year
$ month
               $ day
               <int> 517, 533, 542, 544, 554, 554, 555, 557, 557, 558, 558, ~

                                          "time_hour"
```

Exercise 3 - select()

Make a data frame that only contains the variables dep_delay and arr_delay.

```
delays <- flights %>%
  select(c(dep_delay, arr_delay))
print(delays)
```

```
# A tibble: 336,776 x 2
   dep_delay arr_delay
       <dbl>
                   <dbl>
            2
 1
                      11
2
            4
                      20
            2
3
                      33
 4
           -1
                     -18
 5
           -6
                     -25
6
           -4
                      12
7
           -5
                      19
8
           -3
                     -14
9
           -3
                      -8
           -2
10
                       8
# i 336,766 more rows
```

• Make a data frame that keeps every variable except dep_delay.

```
not_dep_delay <- flights %>%
   select(-dep_delay)

print(not_dep_delay)
```

A tibble: 336,776 x 18

	year	${\tt month}$	day	${\tt dep_time}$	$sched_dep_time$	${\tt arr_time}$	${\tt sched_arr_time}$	${\tt arr_delay}$
	<int></int>	<int></int>	<int></int>	<int></int>	<int></int>	<int></int>	<int></int>	<dbl></dbl>
1	2013	1	1	517	515	830	819	11
2	2013	1	1	533	529	850	830	20
3	2013	1	1	542	540	923	850	33
4	2013	1	1	544	545	1004	1022	-18
5	2013	1	1	554	600	812	837	-25

7	2013	1	1	555	600	913	854	19
8	2013	1	1	557	600	709	723	-14
9	2013	1	1	557	600	838	846	-8
10	2013	1	1	558	600	753	745	8

- # i 336,766 more rows
- # i 10 more variables: carrier <chr>, flight <int>, tailnum <chr>,
- # origin <chr>, dest <chr>, air_time <dbl>, distance <dbl>, hour <dbl>,
- # minute <dbl>, time_hour <dttm>
 - Make a data frame that includes all variables between year through dep_delay (inclusive). These are all variables that provide information about the departure of each flight.

```
rangeflightdf <- flights %>%
  select(c(year:dep_delay))
print(rangeflightdf)
```

A tibble: 336,776 x 6

	year	month	day	dep_time	sched_dep_time	dep_delay
	<int></int>	<int></int>	<int></int>	<int></int>	<int></int>	<dbl></dbl>
1	2013	1	1	517	515	2
2	2013	1	1	533	529	4
3	2013	1	1	542	540	2
4	2013	1	1	544	545	-1
5	2013	1	1	554	600	-6
6	2013	1	1	554	558	-4

7	2013	1	1	555	600	-5
8	2013	1	1	557	600	-3
9	2013	1	1	557	600	-3
10	2013	1	1	558	600	-2

i 336,766 more rows

• Use the select helper contains() to make a data frame that includes the variables associated with the arrival, i.e., contains the string "arr_" in the name.

```
arrival <- flights %>%
  select(contains("arr_"))
print(arrival)
```

A tibble: 336,776 x 3

	arr_time	sched_arr_time	arr_delay
	<int></int>	<int></int>	<dbl></dbl>
1	830	819	11
2	850	830	20
3	923	850	33
4	1004	1022	-18
5	812	837	-25
6	740	728	12
7	913	854	19
8	709	723	-14
9	838	846	-8
10	753	745	8

i 336,766 more rows

Exercise 4 - slice()

• Display the first five rows of the flights data frame.

add code here

• Display the last two rows of the flights data frame.

add code here

Exercise 5 - arrange()

• Let's arrange the data by departure delay, so the flights with the shortest departure delays will be at the top of the data frame.

```
# add code here
```

• Question: What does it mean for the dep_delay to have a negative value?

Add your response here.

• Arrange the data by descending departure delay, so the flights with the longest departure delays will be at the top.

```
# add code here
```

• Your turn: Create a data frame that only includes the plane tail number (tailnum), carrier (carrier), and departure delay for the flight with the longest departure delay. What is the plane tail number (tailnum) for this flight?

```
# add code here
```

Exercise 6 - filter()

• Filter for all rows where the destination airport is RDU.

```
# add code here
```

• Filter for all rows where the destination airport is RDU and the arrival delay is less than 0.

```
# add code here
```

• Your turn: Describe what the code is doing in words.

Add response here.

```
flights |>
  filter(
   dest %in% c("RDU", "GSO"),
   arr_delay < 0 | dep_delay < 0
)</pre>
```

A tibble: 6,203 x 19

	year	month	day	dep_time	sched_dep_time	<pre>dep_delay</pre>	arr_time	sched_arr_time
	<int $>$	<int></int>	<int></int>	<int></int>	<int></int>	<dbl></dbl>	<int></int>	<int></int>
1	2013	1	1	800	810	-10	949	955
2	2013	1	1	832	840	-8	1006	1030
3	2013	1	1	851	851	0	1032	1036
4	2013	1	1	917	920	-3	1052	1108
5	2013	1	1	1024	1030	-6	1204	1215
6	2013	1	1	1127	1129	-2	1303	1309
7	2013	1	1	1157	1205	-8	1342	1345
8	2013	1	1	1317	1325	-8	1454	1505
9	2013	1	1	1449	1450	-1	1651	1640
10	2013	1	1	1505	1510	-5	1654	1655

- # i 6,193 more rows
- # i 11 more variables: arr_delay <dbl>, carrier <chr>, flight <int>,
- # tailnum <chr>, origin <chr>, dest <chr>, air_time <dbl>, distance <dbl>,
- # hour <dbl>, minute <dbl>, time_hour <dttm>

Hint: Logical operators in R:

operator	definition
<	is less than?
<=	is less than or equal to?
>	is greater than?
>=	is greater than or equal to?
==	is exactly equal to?
!=	is not equal to?
x & y	is x AND y?
x \ y	is x OR y?
is.na(x)	is x NA?
!is.na(x)	is x not NA?
x %in% y	is x in y?
!(x %in% y)	is x not in y?
! x	is not x ? (only makes sense if x is TRUE or FALSE)

Exercise 7 - count()

• Create a frequency table of the destination locations for flights from New York.

add code here

• In which month was there the fewest number of flights? How many flights were there in that month?

add code here

• Your turn: On which date (month + day) was there the largest number of flights? How many flights were there on that day?

add code here

Exercise 8 - mutate()

• Convert air_time (minutes in the air) to hours and then create a new variable, mph, the miles per hour of the flight.

add code here

• Your turn: First, count the number of flights each month, and then calculate the proportion of flights in each month. What proportion of flights take place in July?

add code here

• Create a new variable, rdu_bound, which indicates whether the flight is to RDU or not. Then, for each departure airport (origin), calculate what proportion of flights originating from that airport are to RDU.

add code here

Exercise 9 - summarize()

• Find mean arrival delay for all flights.

add code here

Exercise 10 - group_by()

• Find mean arrival delay for for each month.

add code here

• Your turn: What is the median departure delay for each airports around NYC (origin)? Which airport has the shortest median departure delay?

add code here

Additional Practice

Try these on your own, either in class if you finish early, or after class.

Create a new dataset that only contains flights that do not have a missing departure time.
 Include the columns year, month, day, dep_time, dep_delay, and dep_delay_hours
 (the departure delay in hours). Hint: Note you may need to use mutate() to make one
 or more of these variables.

add code here

2. For each airplane (uniquely identified by tailnum), use a group_by() paired with summarize() to find the sample size, mean, and standard deviation of flight distances. Then include only the top 5 and bottom 5 airplanes in terms of mean distance traveled per flight in the final data frame.

add code here
